

Developmental Characteristics of Infants and Children

WEDNESDAY
November 16, 2016

Sensorimotor (0-2 years)	Preoperational (2-6 years)	Concrete operational (6-12 years)	Formal operational (12 years-adult)
The infant explores the world through direct sensory and motor contact. Object permanence and separation anxiety develop during this stage.	The child uses symbols (words and images) to represent objects but does not reason logically. The child also has the ability to pretend. During this stage, the child is egocentric.	The child can think logically about concrete objects and can thus add and subtract. The child also understands conversation.	The adolescent can reason abstractly and thinks in hypothetical terms.
			

Discussion/Case Study Topics to

Include –Anatomic and Physiologic Differences

The Adolescent Patient

Psychological and Personality Characteristics.

SEMINAR

Featuring

ANDY STERN
PC, CIC, EMT-P
